

Frontend Test for ItRecruiter

Planning

Please take a moment to read through the tasks and try to understand, feel free to make it on your own way. This is a project of almost 2 hours, try to not exceed the time for doing it and send it as you have it, we will not see if you can do it on the time, we will take a look to the code and the quality of it and how you do the tasks, focus on what you do best.

Development

Task List

Create a system to handle a task list that does the following:

- Displays two lists of tasks that can have two status: Incomplete and Done
- Allows users the possibility to create new tasks (which are added to the top of the Incomplete list)
- Incomplete tasks can be editable
- Done tasks can be removed
- Allows users to mark Incomplete tasks as Done

Possible solutions:

The presentation should be a single page with the following sections in this order:

- Create / Edit form
- Done (completed) tasks sorted chronologically by the date / time they were
- completed (most recent first)

Requirements:

- You have to use frontend technologies such as angular, html, js, css and node for backend. It will be a plus if you use featherjs.
- This test requires a backend to persistence and will be valued if the candidate makes one.

Please send me an email to peducris@gmail.com after you finished with the code on a rar or the repo link for copy.
